

# SURFICIAL GEOLOGY OF HUNTLEY QUADRANGLE

## MCHENRY AND KANE COUNTIES, ILLINOIS

Prairie Research Institute  
ILLINOIS STATE GEOLOGICAL SURVEY

STATEMAP Huntley-SG

B. Brandon Curry and Jason F. Thomason  
2012

### QUATERNARY DEPOSITS

Description	Unit	Interpretation
<b>HUDSON EPISODE (-14,700 years before present (B.P.) to today)</b>		
<b>Fill (disturbed earth material); primarily material reworked from underlying deposits</b>	Disturbed ground	Disturbed land; embankments and mounds (gray) pits and quarries (open diagonal lines with underlying unit showing through)
<b>Peat and muck; black to brown; interbedded with sand and silt clay (gray) and mud (white to light gray); less than 10 feet thick in most places</b>	Crystal Lake Peat	Decomposed wetland vegetation and sediment in depressions and on slopes associated with discharge of groundwater
<b>Sand and gravel, well-sorted sand, and lenses of peat grading laterally to organic-rich silt and clay; as much as 10 feet thick</b>	Chalkita Formation	Floodplain alluvium
<b>Silt, clay, and fine sand; gray to brown; layered to massive; with local wood fragments; moss gastropod shells, ostracodes, leaves, and corals in many places; surficial deposits are generally less than 20 feet thick</b>	Equality Formation	Lake deposits in ice-walled lakes, postglacial kettles, and postglacial lakes
<b>WISCONSIN EPISODE: Michigan Subepisode (-29,000-14,700 years B.P.)</b>		
<b>Sand and gravel, or sand; with lenses of silt and clay; diameters: yellowish brown, brown to gray; generally stratified; up to 70 feet thick</b>	Henry Formation	Proglacial outwash along upper tributaries of Kishwaukee River valley
<b>Silt, fine sand; gray to brown; layered to massive; with local wood fragments; moss up to 50 feet thick</b>	Equality Formation, undivided	Lake deposits in ice-walled lakes, postglacial kettles, and postglacial lakes
<b>Diamictite: silt clay, silt clay loam, and clay, gray, oxidizing to yellowish brown; includes layers of sand and gravel, silt, and silt clay; as much as 35 feet thick</b>	Yorkville Member, Lenoir Formation	Till, debris flow deposits, and lake sediment associated with the Barlow and Huntley moraines
<b>Sand and gravel with interbeds of silt and clay; gray, stratified to laminated; as much as 30 feet thick</b>	Henry Formation (some sections only)	Proglacial outwash and deltaic deposits(?) underlies deposits of the Yorkville Member
<b>Diamictite: clay loam to loam matrix (roughly equal amounts of sand, silt, and clay) with lenses of sand and gravel or sand gray; as much as 30 feet thick</b>	Balsbrom Member, Lenoir Formation	Till and debris flow deposits
<b>Diamictite: loam to sandy loam; brown to brownish gray, oxidizing to yellowish brown; includes layers of sand and gravel, silt, and silt; as much as 50 feet thick</b>	Tiskiawa Formation	Till, debris flow deposits, and outwash associated with the Gilberts Drift and Huntley moraine
<b>Sand and gravel, and sand with thin beds of diamictite and silt; brown; stratified; as much as 50 feet thick</b>	Ashmore Tongue, Henry Formation (some sections only)	Proglacial outwash deposited in alluvial fans and in deltaic underlies deposits of the Tiskiawa Formation
<b>ILLINOIS EPISODE (-200,000-130,000 years B.P.)</b>		
<b>Diamictite and sorted sediment, primarily sand and gravel; the diamictite is bouldery in places, with abundant lenses, layers, and channel fills of sand and gravel; the diamictite matrix is sandy loam to loam and reddish brown, pinkish brown, or brown. The diamictite is as much as 50 feet thick, and the sand and gravel, 35 feet thick</b>	Classified Formation (some sections only)	Till and debris flow deposits (diamictite) and outwash (sand and gravel)

### PALEOZOIC BEDROCK

Description	Unit	Interpretation
<b>Dolomite (dense, brown, and argillaceous or dark gray and white, waxy, fossiliferous patches); clay dolomite (mud, gray and brown); shale (soft to friable, greenish gray, or brown)</b>	Near-surface bedrock	Dolomitized carbonate bank deposits; subtidal to intertidal clastic deposits interbedded with dolomitized carbonate bank deposits; and dolomitized carbonate shelf deposits

### Data Type

- Stratigraphic boring
- Water well boring
- Boring label indicates the county number. Dot indicates boring is to bedrock.

**A—A'** Line of cross section

Note: The county number is a portion of the 12-digit API number on file at the ISGS Geological Records Unit. Most well and boring records are available online from the ISGS Web site.

Base map compiled by Illinois State Geological Survey from digital data (2011 TIGERLine) digitized provided by the United States Census Bureau. Hillshade and contours derived from 2008 USGS and INR LIDAR source data.  
North American Datum of 1983 (NAD 83)  
Projection: Transverse Mercator  
1,000-foot scale, Illinois State Plane Coordinate system, east zone (Transverse Mercator)  
1,000-meter scale, Universal Transverse Mercator grid system, zone 16
